

Felix NDAYISABYE

Self-Reflection on our project SCATTERING OF ELECTROMAGNETIC WAVES FROM FLATE SURFACE OF GLASS MATERIAL:

The pairing project we are doing together with my partner is moving on well and since the beginning up to now we have a positive progress, both of us are contributing. Every one go with the project question of the week and then over the weekend we meet and try to put together what we have and make something good to submit. The main challenge we got during this week was to design the poster that we will present at the end before we have the final results. This was difficult for me as well as for my partner because it was the first time for us to present our work us a poster but we tried our best. Therefore graphs present in submitted poster in results section are not our results from our model but it is just to show how our results will look like. We will use one dimension in Maxwell's equations to study the light scattering on glass as our objectives in this project. This model will help us to explain the phenomena of rainbow formation and we almost have what we need to achieve our goals.

Question to ask you, are we suppose to submit a poster or a paper to the end of this semester?

Thanks.

Felix.
